

REQUIRMENTS ON ALL TRUCKS

Commercial Vehicle Enforcement

If the company is not a hazmat carrier or a bus transporting passengers, then vehicles that have GVWRs of 10,001 pounds up to 26,000 pounds will require a fire extinguisher (two 4BC or one 5BC) and three warning devices (either 3 triangles, flares, or electric lanterns). You can have orange cones, however, per the regulations; cones are only in addition to the required warning devices and would not meet the 393.95 requirements by themselves. The company name or DOT number is not a requirement for the DOT regulations. Other than ensuring all vehicle parts are in working order and load securement is in compliance, that is all that we look for.

Vehicles that have GVWRs of 26,001 pounds and more require a fire extinguisher (two 4BC or one 5BC) and three triangles. The company name and DOT number must be displayed on both sides of the power unit. The markings must be visible from 50 feet in the daytime while the vehicle is stationary. The vehicle must have an annual inspection by a certified mechanic once per year and a decal can be attached to the power unit or a copy of the inspection must be carried on board the vehicle at all times (If a CVE unit conduct a Level 1 inspection, that will suffice as an annual inspection as long as a copy is kept in the vehicle).

Also on both 10,001 & 26,001 vehicles you must carry spare fuses per 393.95(b).
